Understanding the World Map with Latitude and Longitude

What Are Latitude and Longitude?

Latitude and longitude are the two main coordinates used to specify any location on Earth precisely.

- **Latitude:** Measures the distance north or south of the Equator, which is at 0° latitude. It ranges from 0° at the Equator to 90° North at the North Pole and 90° South at the South Pole.
- **Longitude:** Measures the distance east or west of the Prime Meridian, which is at 0° longitude, passing through Greenwich, England. It ranges from 0° to 180° east or west. These coordinates are expressed in degrees (°), minutes ('), and seconds ("), offering a detailed way to pinpoint locations.

The Structure of a World Map with Latitude and Longitude

Grid System on the Globe

A world map with latitude and longitude overlays a grid system that divides the Earth into a network of intersecting lines:

- **Horizontal lines:** Known as parallels, they run east-west and measure latitude.
- **Vertical lines:** Known as meridians, they run north-south and measure longitude.

This grid allows for precise identification of any point on Earth's surface.

How to Read Coordinates on a Map

To locate a specific place: 1. Find the latitude line (parallel) closest to the location. 2. Find the longitude line (meridian) closest to the location. 3. The intersection point of these lines gives the exact position. For example, the coordinates of New York City are approximately 40.7128° N (latitude) and 74.0060° W (longitude).

Historical Development of Latitude and Longitude

Origins and Early Use
